From fictional concepts to changing how world works
Timeline of AI

Presented by:
Bandarupalli Suneel, Karri Mounika, Kommineni Jagadeesh Kumar,
Lee Joowon, Luwedde Sandra, Solanki Pruthviraj Surendrasinh, Syed Asim Minhaj

1950 The imitation Game	Alan turing created the test that gave birth to a concept that asks for creation of a machine that can imitate a human.
1966 ELIZA	First computer program to generate human emotions from a simulated conversation at MIT - author of the program Joseph Weizenbaum
1968 HAL - 9000	First depiction of machine intelligence in fictional media in 2001: A Space Odyssey
1997 Hamlet on the holodeck	Janet Murray examines how computing could transform narrative through immersion, agency, and participation.

Initiation: The Math Behind the Machine

KEY POINTS

- Before anyone called it AI, Gauss used a quill and data points to predict an asteroid — the same formula we run in Excel today
- McCulloch & Pitts modeled how a brain neuron fires — as a math equation, on paper, no computer
- Arthur Samuel built a checkers program that learned only from win or lose — and beat its own creator
- He called it **machine learning** — same math as regression, now running on a machine

THE CORE IDEA

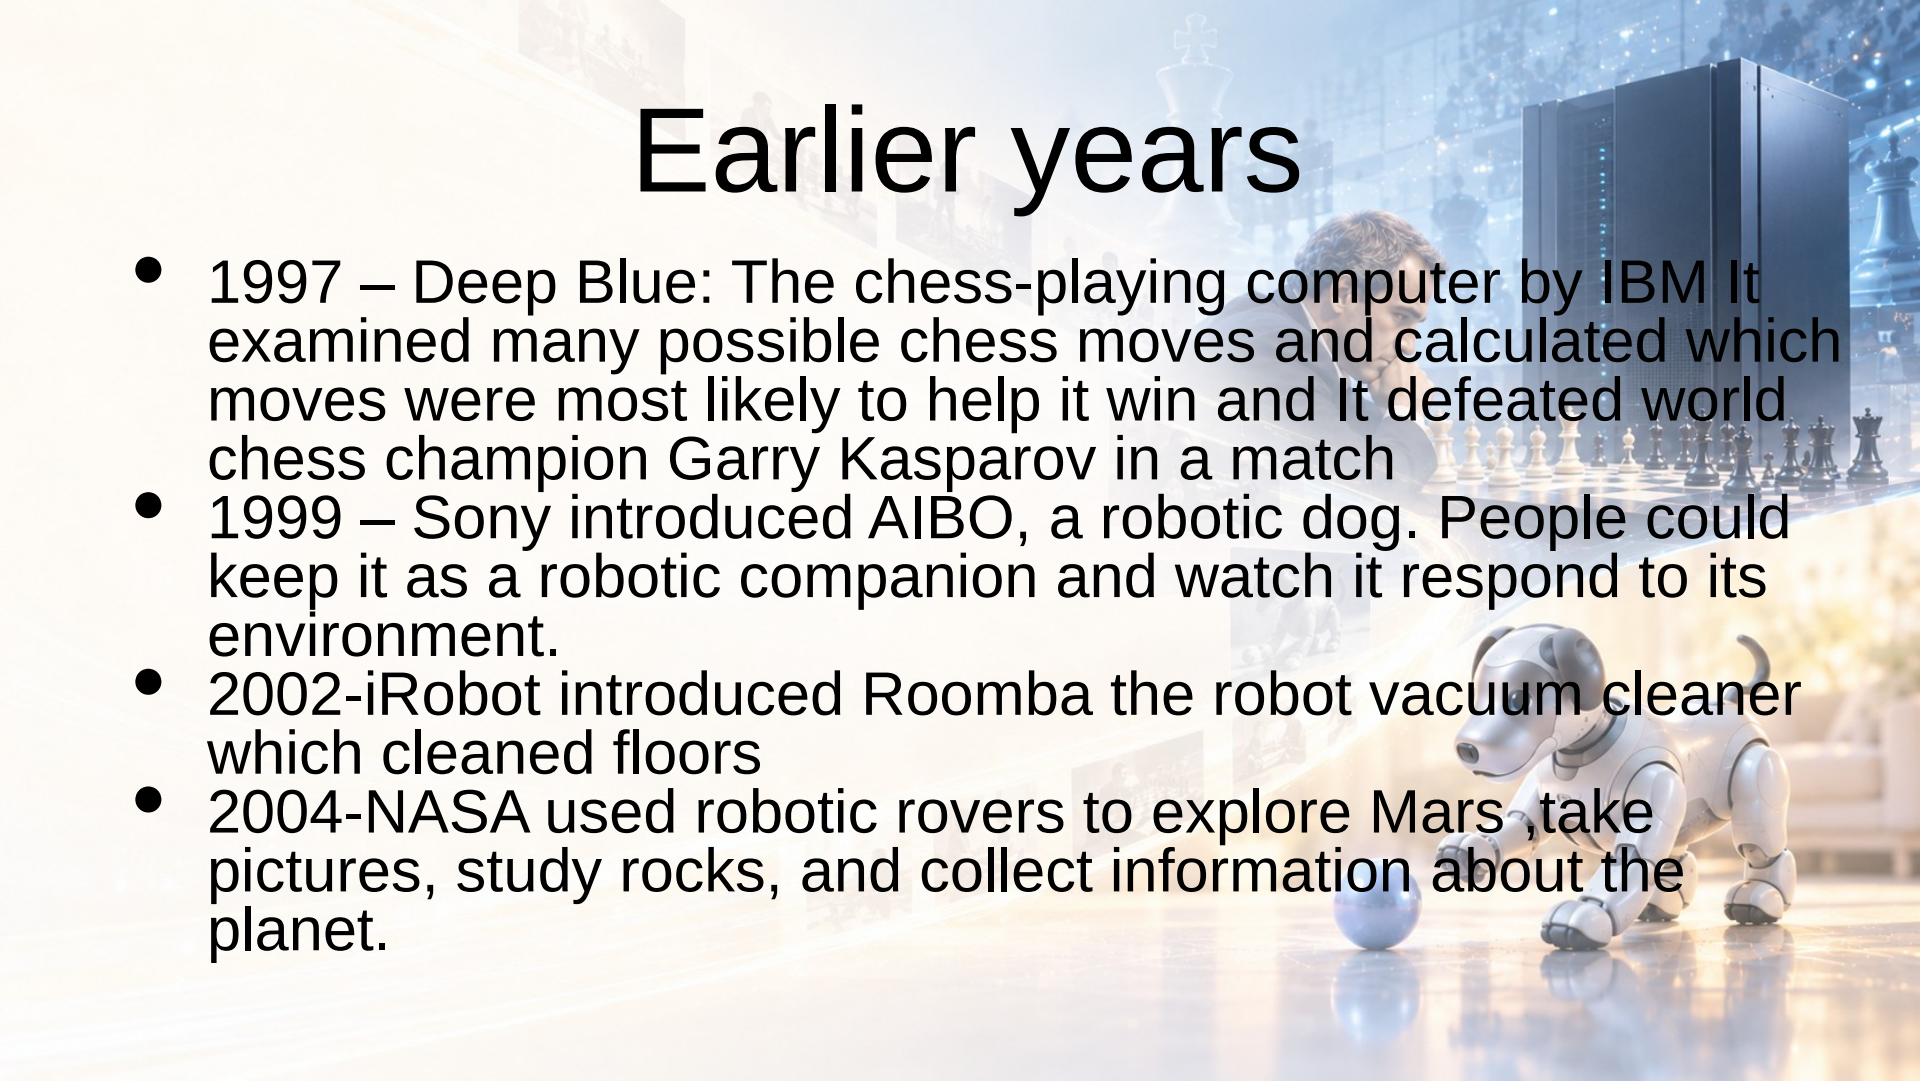

Regression is just finding the best-fit line through data. Gauss did it by hand. Samuel did it with a machine. ChatGPT does it with billions of parameters. **Same idea — 200 years apart.**

THE CHAIN

1805	1952	Today
Best-fit line, by hand	Best-fit moves, by machine	Billions of parameters

Earlier years

- 1997 – Deep Blue: The chess-playing computer by IBM It examined many possible chess moves and calculated which moves were most likely to help it win and It defeated world chess champion Garry Kasparov in a match
- 1999 – Sony introduced AIBO, a robotic dog. People could keep it as a robotic companion and watch it respond to its environment.
- 2002-iRobot introduced Roomba the robot vacuum cleaner which cleaned floors
- 2004-NASA used robotic rovers to explore Mars ,take pictures, study rocks, and collect information about the planet.

Deep Learning Milestone

AlexNet

layers 01

CNN Architecture

Convolutional Neural Network (CNN) architecture designed specifically for high-accuracy Image Classification.

memory 02

Dual GPU Power

Harnesses two NVIDIA GTX 580 GPUs simultaneously to train unprecedented network scales.

speed 03

Paradigm Shift

Proved conclusively that GPU-trained deep models drastically outperform traditional computer vision methods.

auto_awesome 04

AI Catalyst

Served as the fundamental catalyst that triggered the current global AI revolution and deep learning boom.

groups 05

Creators & Year

Created in 2012 by Alex Krizhevsky, a graduate student at the University of Toronto.

Generative AI

- Rapid shift from pattern recognition to content creation
- Anchored by the **Transformer architecture** and **self-attention mechanisms** introduced in 2017
- DALL·E (2021) and ChatGPT (2022) brought AI to the public - shifting focus from research to real workflows

AI reflection : How has AI changed humanity?

The positive and negative impact of Artificial Intelligence

Positive Impacts

- Healthcare: More accurate and timely diagnosis can improve patients' lives.
- Education: Learning has become more accessible and personalized.
- Work and Productivity: People can spend less time on repetitive tasks and more on creative work

Negative impacts

- AI Dependency : Overreliance on AI may weaken critical thinking, creativity, and independent decision-making
- Privacy Concerns : AI raises concerns about personal data collection and privacy
- Bias and Discrimination : Biase AI systems may lead to unfair or discriminatory decisions
- Misinformation : AI generated fake news, images, and videos can spread false information

Evaluation Of AI- Devaluation Of Earth

Carbon Footprint:

1. **Power Usage: 1000 Ai images needs 4.1 miles of gas used for car**
2. **Fresh Water : Every Ai image need 2 tablespoons of fresh water to cool down**
3. **Carbon Emission: Every Ai Image news 1.3 to 1.6 grams of Co2 equivalents**

Thank You

Q & A

Chat-GPT was used for generating the backgrounds of each slide.
